Our earlier reported observation of the existence of a liquid phase of sulfur at 120 kelvin is subject to a significant question, since the long-term stability of the long-term observation was inconclusive. Therefore, a new model of sulfur isothermal run was performed in this study using a greater number of scans in much shorter time (1 week instead of 2 years). It was found that the liquid sulfur was indeed formed. The maximum density at 80 kelvin is 2.82 g cm⁻³, which is lower than previously reported values at about 2.89 g cm⁻³. The use of xenon instead of argon as the principal fluid has been introduced to determine the density at 20 kelvin. The maximum density at 20 kelvin is 2.93 g cm⁻³, which is lower than previously reported values at about 2.95 g cm⁻³. The temperature of formation of the liquid sulfur was found to be 77.0 kelvin, while the temperature of liquefaction of solid sulfur was 91.2 kelvin. The solubility of sulfur in all these liquids is significantly larger than that in argon. The average density and the stability of the sulfur liquid was found to increase with decreasing solubility in the liquid. As the density of sulfur liquid approached the solvent density, the instability increased. The size of the nucleus in liquid sulfur was found to be in the range of 1-3 microm in diameter.Metropolitanism In Roman Catholic, Eastern Orthodox and Oriental Orthodox theology, Metropolitanism is the belief that each geographic area within a given religious community is united by its head or bishop. Origin of the term In late antiquity, the term metropolitan was used in Latin-speaking countries to describe the primatial title of the Archbishop of the capital city of the Roman Empire. Latin metropolis comes via Greek metropolis, from where it is derived. d4474df7b8
